

## Product Sheet Version 2.92

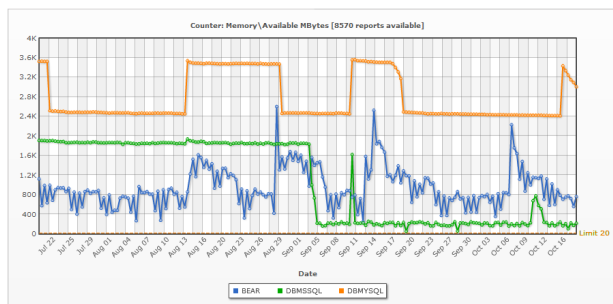

**EventSentry** is the award-winning, proactive, real-time monitoring solution that watches over your workstations, servers and network devices to ensure maximum availability and that also helps with PCI, SOX, HIPAA and other compliance requirements.

With EventSentry you can consolidate and monitor event logs and log files in real-time as well as monitor performance, disk space, services, processes and software installations on servers and workstations. EventSentry also integrates with Nessus®.

Becoming compliant is easier than ever with our newly improved [Compliance Tracking Features](#). Track processes, console and network logons, file access, account management events, print jobs and even policy change events.

Additional features include a wide range of environmental monitoring options (e.g. temperature, water), embedded scripts with a built-in [application scheduler](#) for custom monitoring, scheduled event log backups and NTP synchronization.

Our web reporting (ships in 6 languages, including English, French, German and Japanese) supports granular authentication down to the computer level, sophisticated reports that can be configured to require a review and the popular computer overview, network and dashboard status pages.

EventSentry includes a free iPhone app and desktop widgets, which allow you to view the health status of your servers and network directly from your iPhone or the desktop.

For real-time notifications, EventSentry supports a variety of alerts including email, Jabber, HTTP, Snmp and more.

# Features Overview:

## Event Log Monitoring

Real-Time event log monitoring and database consolidation that supports advanced features such as thresholds, recurring events, timers, insertion strings and summary notifications.

## Compliance Tracking

Track file access activity, any process or console logons, review successful or failed network logons, track account management and policy change events as well as print jobs.

## Log File Monitoring

Monitor any log file (e.g. IIS, DHCP, Backup, Firewall) and consolidate data into a database or receive alerts upon matching text. Powerful web-based reports are available for delimited log files.

## Performance Monitoring

Monitors any Windows performance counter and supports smart alerts as well as performance data collection over time for long-term trend reports. Alerts support attached charts.

## Process & Service Monitoring

Pro-actively monitors services and stand-alone processes. EventSentry can also automatically restart failed processes and services.

## Disk Space Monitoring

Receive alerts based on absolute or percentage limits on drives or folders. View and predict disk space usage with graphical web reports.

## Network Time Synchronization

Real-Time event log monitoring and database consolidation that supports advanced features such as thresholds, recurring events, timers and summary notifications.

## Extensive SW / HW Inventory

Records installed software and hardware information (OS edition, CPU core count, model/serial nr., memory bank info, NIC speed and more).

## Package Management

The easy-to-use management interface which allows you to administer your remote installations from one central point with the new event log, log file, health and compliance packages.

## Notifications

EventSentry includes [16 different notification types](#) including: SMTP Email, Jabber (IM), database, HTTP(S), SNPP, SNMP, RSS, text file, network, Syslog, processes, dot-matrix printers, reboot, service control, sound and desktop.

## NO-Impact Monitoring

Our agents monitor your hosts without affecting the performance of the machine being monitored, while also minimizing network bandwidth usage. EventSentry is also an economical solution that fits most budgets.

## Mobile

Check your monitored from anywhere with your iPhone®, with EventSentry™ Mobile. Other mobile platforms coming in late 2011.

## Web Reporting

Open-Source Web Reporting that works with all major browsers. Features include various dashboards, granular access control, extensive graphical reports as well as desktop widgets.

## Heartbeat Monitoring

Centrally monitors the uptime of hosts and TCP services and provides availability stats.

## Syslog / SNMP Daemon

Collects Syslog messages and SNMP traps (v1-v3) from Unix/Linux hosts and/or network devices which can send SNMP and/or Syslog messages. Supports alerts as well as database consolidation.

## Uptime Monitoring

Continuously logs the current uptime as well as the uptime history across reboots. Helps identify problematic servers that are rebooted too often and also records the longest uptime.
